

Certification Requirement Notice — Seal Interface Revalidation

Certification · 2024-11 · Issue 1

1. Basis

Certification approval for the assembly family is held against the configuration recorded in the approved technical file. Where a characteristic recorded in that file is altered, the approval is held against the superseded configuration until the altered configuration is evidenced.

The seal material recorded against the housing interface has been altered to FKM-70. The interface is a certified characteristic. Accordingly, **revalidation required following the material change** before the altered configuration may be evidenced against the existing approval.

Field	Entry
Requirement reference	CERT-RQ-2024-31
Raised	2024-11-08
Trigger	Alteration to a certified characteristic
Approval affected	Assembly family, seal interface
Status	Scheduled

Until the requirement is discharged, the approved technical file continues to record the superseded configuration and the certification position is unchanged.

2. Scope of revalidation

The revalidation comprises the interface test sequence defined in the approved test plan, performed on the altered configuration and witnessed in accordance with the witnessing arrangement.

Element	Requirement
Interface test sequence	Full sequence, altered configuration
Thermal cycling	Per approved test plan
Witnessing	Per witnessing arrangement
Report	Submitted to the approval holder
Status at issue of this notice	Scheduled, not yet performed

Partial revalidation is not accepted for an alteration to a certified characteristic. The sequence is to be performed in full.

The requirement remains against the approval until the report is submitted and accepted. Rig availability for the sequence is arranged through the test laboratory under the usual booking arrangement.
