

Site Services Handbook

Facilities · 2025-09 · Revision 7

1. Site services

This handbook sets out the services provided by Facilities across the group's manufacturing sites, the standard of service applying to each, and the route for requesting service outside the standard provision.

Service	Standard provision	Request route
Cleaning, production areas	Daily, end of second shift	Standing
Cleaning, office areas	Daily	Standing
Waste removal, general	Twice weekly	Standing
Waste removal, controlled	Weekly, scheduled	Booking
Grounds maintenance	Fortnightly, seasonal	Standing
Pest control	Monthly inspection	Standing
Compressed air, plant	Continuous	Standing
Process water	Continuous	Standing
Heating and ventilation	Per site profile	Standing

Services listed as standing are provided without request. Services listed as booking require a request through the facilities booking system, raised at least five working days before the service is required.

Requests outside the standard provision are assessed on receipt and confirmed or declined within two working days. Where a request is declined, the reason is given and an alternative provision proposed where one exists.

Utilities provision is monitored continuously and reported monthly. Reporting covers consumption against the site profile and any interruption to supply, with the duration of each interruption and the service affected.

Utility	Monitoring	Reporting
Electricity	Continuous, metered	Monthly
Compressed air	Continuous, metered	Monthly
Process water	Continuous, metered	Monthly
Gas	Continuous, metered	Monthly

Interruptions to utilities provision are logged and reported irrespective of duration. The log is held by Facilities and is available to site management on request.

Access to plant rooms is restricted to Facilities personnel and to contractors holding a current permit. Permits are issued under the arrangement in section 3.

2. Bamberg site quality overview

This section describes the facilities provision supporting quality activity at the Bamberg site and the standards to which that provision is maintained. It describes facilities, not product.

The site operates a dedicated quality area comprising an incoming inspection bay, a measurement room and a document store. The measurement room is environmentally controlled and monitored continuously, as measurement equipment held there requires stable ambient conditions to retain calibration between scheduled intervals.

Area	Provision	Environmental control
Incoming inspection bay	140 square metres, bench and rack	Ambient
Measurement room	45 square metres	Controlled, monitored
Document store	30 square metres, racked	Controlled humidity
Quality office	60 square metres	Ambient

Environmental conditions in the measurement room are logged continuously and reported monthly to site management. The service standard for the room is stated below and has been met in every reporting period since the current revision of this handbook was issued.

Parameter	Service standard	Reporting
Temperature	Within stated band	Monthly
Relative humidity	Within stated band	Monthly
Ambient particulates	Within stated band	Quarterly
Lighting level at bench	Within stated band	Annual

The quality areas are cleaned to the enhanced standard applying to controlled areas, which is a separate provision from the general production cleaning standard set out in section 1. Cleaning of the measurement room is performed by Facilities personnel trained in the enhanced standard and is recorded against each attendance.

Facilities provision for quality activity at the site is reviewed annually with site management. The last review confirmed the provision as adequate for the activity held at the site, with no change requested.

The quality areas hold the document store for the site. Storage provision, racking and retrieval arrangements are a facilities matter; the content of stored records and any activity recorded in them are outside the scope of this handbook and of Facilities generally.

3. Contractor access

Contractors requiring access to site shall hold a current permit. Permits are issued by Facilities on receipt of a completed application and the required documentation.

Permit class	Covers	Validity
Class 1	General access, escorted	Single visit
Class 2	General access, unescorted	12 months
Class 3	Plant rooms and roof access	6 months
Class 4	Hot work and confined space	Per task

Applications are assessed against the documentation required for the permit class. Incomplete applications are returned and are not held pending.

Documentation	Class 1	Class 2	Class 3	Class 4
Insurance certificate	Required	Required	Required	Required
Method statement	Not required	Not required	Required	Required
Competence evidence	Not required	Required	Required	Required
Task risk assessment	Not required	Not required	Not required	Required

Permit holders shall report to reception on each attendance and shall sign in and out. A permit does not confer access outside the areas stated on it.

Permits may be withdrawn by Facilities at any time. Withdrawal takes effect immediately and is notified to the contractor and to the requesting function.
